Experiment No. 6
Apply Boosting Algorithm on Adult Census Income Dataset and analyze the performance of the model
Date of Performance: 04/09/2023
Date of Submission: 24/09/2023

Aim: Apply Boosting algorithm on Adult Census Income Dataset and analyze the performance of the model.

Objective: Apply Boosting algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score.

Theory:

Suppose that as a patient, you have certain symptoms. Instead of consulting one doctor, you choose to consult several. Suppose you assign weights to the value or worth of each doctor's diagnosis, based on the accuracies of previous diagnosis they have made. The final diagnosis is then a combination of the weighted diagnosis. This is the essence behind boosting.

Algorithm: Adaboost- A boosting algorithm—create an ensemble of classifiers. Each one

gives a weighted vote.

Input:

- D , a set of d class labelled training tuples
- k, the number of rounds (one classifier is generated per round)
- a classification learning scheme

Output: A composite model

Method

1. Initialize the weight of each tuple in D is 1/d
2. For i=1 to k do // for each round
3. Sample D with replacement according to the tuple weights to obtain D_i
4. Use training set D_i to derive a model M_i
5. Computer error(M_i), the error rate of M_i
6. Error(M_i)=$\sum w_j$*err(X_j)
7. If Error(M_i)>0.5 then
8. Go back to step 3 and try again
9. endif
10. for each tuple in D_i that was correctly classified do
11. Multiply the weight of the tuple by error(Mi)/(1-error(M_i)
12. Normalize the weight of each tuple
13. end for

To use the ensemble to classify tuple X

1. Initialize the weight of each class to 0
2. for i=1 to k do // for each classifier
3. w_i=log((1-error(M_i))/error(M_i))//weight of the classifiers vote
4. C=M_i(X) // get class prediction for X from M_i
5. Add w_i to weight for class C
6. end for
7. Return the class with the largest weight.

Dataset:

Predict whether income exceeds $50K/yr based on census data. Also known as "Adult" dataset.
Attribute Information:
Listing of attributes:

>50K, <=50K.

age: continuous.
workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov, State-gov, Without-pay, Never-worked.

fnlwgt: continuous.
education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm, Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th, Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated, Widowed, Married-spouse-absent, Married-AF-spouse.

occupation: Tech-support, Craft-repair, Other-service, Sales, Exec-managerial, Prof-specialty, Handlers-cleaners, Machine-op-inspct, Adm-clerical, Farming-fishing, Transport-moving, Priv-house-serv, Protective-serv, Armed-Forces.

relationship: Wife, Own-child, Husband, Not-in-family, Other-relative, Unmarried.

race: White, Asian-Pac-Islander, Amer-Indian-Eskimo, Other, Black.

sex: Female, Male.

capital-gain: continuous.

capital-loss: continuous.

hours-per-week: continuous.

native-country: United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinadad &Tobago, Peru, Hong, Holand-Netherlands.

Conclusion:

1. Accuracy, Confusion Matrix, Precision, Recall, and F1 Score:

1)AdaBoost: achieved an accuracy of approximately 86.38% and demonstrated strong precision at 79.21%. However, it had a lower recall rate of 63%, resulting in an F1 Score of 0.7008.

2)Gradient Boosting: delivered a similar accuracy of approximately 86.90% but improved the recall to 67%, resulting in a higher F1 Score of 0.7219.

3)XGBoos:t performed competitively with an accuracy of around 86.55%, exhibiting precision of 78.67%. Its recall rate was 65%, leading to an F1 Score of 0.7091.

2. When comparing the results obtained by applying boosting (AdaBoost, Gradient Boosting, and XGBoost) and the Random Forest algorithm on the Adult Census Income Dataset:

1)Accuracy: All four algorithms achieved relatively similar accuracy, with Random Forest at around 84.43%, AdaBoost at approximately 86.38%, Gradient Boosting at about 86.90%, and XGBoost at around 86.55%.

2)Confusion Matrix: Each algorithm showed variations in True Positive, True Negative, False Positive, and False Negative values, indicating differences in their ability to correctly classify instances in different income classes.

3)Precision, Recall, F1-Score: Random Forest achieved a balance between precision and recall, especially for income classes, with F1-Scores of around 0.90 for "income = 0" and 0.65 for "income = 1." Boosting algorithms also demonstrated competitive F1-Scores, with AdaBoost at 0.7008, Gradient Boosting at 0.7219, and XGBoost at 0.7091.

4)Generalization: Random Forest benefits from ensemble learning, aiding in better generalization. In contrast, Decision Trees (Random Forest's base) can overfit without depth control.

5)Stability: Random Forest is more stable due to ensemble averaging, making it less sensitive to data variations. Boosting algorithms might exhibit higher sensitivity.

6)Training Time: Decision Trees (used in Random Forest) tend to train faster since they are single trees. In contrast, boosting algorithms train multiple trees and may take longer.
