Experiment No. 6

Apply Boosting Algorithm on Adult Census Income Dataset and analyze the performance of the model

Date of Performance: 04/09/2023

Date of Submission: 25/09/2023

Department of Computer Engineering

**Aim:** Apply Boosting algorithm on Adult Census Income Dataset and analyze the performance of the model.

**Objective:** Apply Boosting algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score.

### Theory:

Suppose that as a patient, you have certain symptoms. Instead of consulting one doctor, you choose to consult several. Suppose you assign weights to the value or worth of each doctor's diagnosis, based on the accuracies of previous diagnosis they have made. The final diagnosis is then a combination of the weighted diagnosis. This is the essence behind boosting.

Algorithm: Adaboost- A boosting algorithm—create an ensemble of classifiers. Each one gives a weighted vote.

#### **Input:**

- D, a set of d class labelled training tuples
- k, the number of rounds (one classifier is generated per round)
- a classification learning scheme

Output: A composite model

#### Method

- 1. Initialize the weight of each tuple in D is 1/d
- 2. For i=1 to k do // for each round
- 3. Sample D with replacement according to the tuple weights to obtain D<sub>i</sub>
- 4. Use training set D<sub>i</sub> to derive a model M<sub>i</sub>
- 5. Computer  $error(M_i)$ , the error rate of  $M_i$
- 6. Error( $M_i$ )= $\sum w_i * err(X_i)$
- 7. If  $Error(M_i) > 0.5$  then
- 8. Go back to step 3 and try again
- 9. endif
- 10. for each tuple in D<sub>i</sub> that was correctly classified do
- 11. Multiply the weight of the tuple by error(Mi)/(1-error(M<sub>i</sub>)
- 12. Normalize the weight of each tuple
- 13. end for

### To use the ensemble to classify tuple X

1. Initialize the weight of each class to 0

Department of Computer Engineering

- 2. for i=1 to k do // for each classifier
- 3.  $w_i = log((1-error(M_i))/error(M_i))//weight of the classifiers vote$
- 4.  $C=M_i(X)$  // get class prediction for X from  $M_i$
- 5. Add w<sub>i</sub> to weight for class C
- 6. end for
- 7. Return the class with the largest weight.

#### **Dataset:**

Predict whether income exceeds \$50K/yr based on census data. Also known as "Adult" dataset.

Attribute Information:

### **Conclusion:**

- 1. Comment on the accuracy, confusion matrix, precision, recall and F1 score obtained.
  - The model has a relatively high accuracy, indicating overall good performance.
  - The precision and recall values show that the model is better at identifying class 0 instances (higher precision and recall) compared to class 1.
  - The F1 score balances precision and recall, providing an overall measure of the model's effectiveness.
- 2. Compare the results obtained by applying boosting and random forest algorithm on the Adult Census Income Dataset.
  - AdaBoost achieves a slightly higher accuracy compared to Random Forest.
  - In terms of precision, recall, and F1-score for class 0 (non-spam), AdaBoost performs better than Random Forest.
  - For class 1 (spam), Random Forest has a lower precision, recall, and F1-score compared to AdaBoost.
  - Overall, AdaBoost tends to perform slightly better in terms of classification metrics, especially for identifying spam emails.
